(54) Title: ROTATING REGULATING DEVICE

(57) Abstract: A rotating regulating device (1) for the rotation and/or linear displacement of an actuating element (2) of a valve, throttle, blowout preventer or similar, in particular in the field of gas or oil supply, exhibits a spindle drive (3) and a drive train (4) rotationally driving the spindle drive, the said drive train exhibiting at least one reduction gear unit (5) and a drive device (6) connected to it for movement. In order that the regulation of the actuating element is possible in an extremely accurate, finely controlled and reproducible manner even with different drive devices and with simple and compact construction, the rotating spindle (7) or nut (8) of the spindle drive (3) exhibits at least one engaging element (9, 10), essentially protruding radially outwards, which engages guide slots (11, 12, 13, 14), whereby a first guide slot (11, 13) is fixed relative to a device housing (15) and a second guide slot (12, 14) can be rotated relative to the device housing and/or is supported for displacement in the longitudinal direction of the rotating spindle (16), whereby the guide slots (11, 13, 12, 14) exhibit at least different slopes in the longitudinal direction of the rotating spindle and the movable guide slot is connected for movement to the actuating element.
